<b>11.7 Chronic:</b>	This product contains small quantities of crystalline silica. In a 1997 Monograph (Volume 68, "Silica, some Silicates, Coal Dust and Para Aramid Fibrils") the International Agency for research on Cancer (IARC) reviewed various mineral products containing crystalline silica. In its evaluation, IARC noted that "There is inadequate evidence in experimental animals for the carcinogenicity of uncalcined diatomaceous earth". It further noted that "Amorphous silica is not classifiable as to its carcinogenicity to humans (Group 3)". Natural, uncalcined diatomaceous earth which predominantly amorphous silica and may contain trace quantities of crystalline silica, is considered to be Group 3, not classifiable as to its carcinogenicity (not WHMIS regulated).
Calcined diatomaceous earth, such as Floor Dry and Celatom MP grades, which do not contain crystalline silica at levels above that of the natural grades are considered "toxicologically indistinguishable" from the natural grades and do not meet the criterion for controlled products under S.54 of the Controlled Products Regulations.
